                                                                                                                                                                                                                                                                                                        To identify a cDNN from potato which codes for citrate synthase, a cDNA fragment of citrate synthase from Arabidopsis thaliana was firstly amplified using A.thaliana cDNA and oligos T04202 and T04203 which are complementary to the 5' or 3' end of the coding region of A. thaliana CDNA for citrate synthase. The oligos additionally introduce BamHI cleavage sites at both ends of the amplified cDNA fragment. a cDNA library was prepd. from potato leaves and screened with A. thaliana citrate synthase CDNA. Positive clones were benufied and sequenced Then the sequence is given in T04199. Sequence 1891 BP; 512 A; 770 C; 425 G; 584 T;
